About this Review

Guide to navigation

BP Statistical Review of World Energy June 2009 uses the following icons and colour coding to help you navigate your way quickly and easily through the document. Icons and colours represent various energy types so you can see, at a glance, which section you are in.

Natural gas

Nuclear energy

Hydroelectricity

Primary energy

For 58 years, the BP Statistical Review of World Energy has provided high-quality, objective and globally consistent data on world energy markets. The Review is one of the most widely respected and authoritative publications in the field of energy economics, used for reference by the media, academia, world governments and energy companies. A new edition is published every June.

Find out more online

BP Statistical Review of World Energy June 2009 is available online at www.bp.com/statisticalreview. The website contains all the tables and charts found in the latest printed edition, plus a number of extras, including:

- Historical data from 1965 for many sections.
- Additional data for natural gas, coal, hydroelectricity, nuclear energy, electricity and renewables.
- An energy charting tool, where you can view predetermined reports or chart specific data according to energy type, region and year.
- An oil, natural gas and LNG conversion calculator.
- PDF versions and PowerPoint slide packs of the charts, maps and graphs, plus an Excel workbook of the historical data.

About BP

BP is one of the world's largest oil and gas companies, serving millions of customers in more than 90 countries across six continents. Our business segments are Exploration and Production, and Refining and Marketing. Through these business segments, we provide fuel for transportation, retail brands and energy for heat and light.

Approximate conversion factors and definitions

The data series for proved oil and gas reserves in *BP Statistical Review of World Energy June 2009* does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance, under UK accounting rules contained in the Statement of Recommended Practice, 'Accounting for Oil and Gas Exploration, Development, Production and Decommissioning Activities' (UK SORP) or as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country. Rather, the data series has been compiled using a combination of primary official sources and third-party data.

Group chief executive's introduction

Energy in 2008 followed the economic headlines

Tony Hayward Group Chief Executive
June 2009

Welcome to the 2009 edition of the BP Statistical Review of World Energy.

2008 was a year of truly unprecedented developments, for the world economy and in energy markets. Prices for all forms of traded energy rose steeply, some reaching record highs, and then fell dramatically. Producers and consumers alike are wondering where global energy markets are headed, and how to manage the myriad issues around energy, including price volatility, security and climate change.

In challenging times such as these, clear and objective perspectives are needed, and this is what BP's Statistical Review has offered for 58 years. I hope you will find this Review to be a useful source of information on today's energy situation – and a source of insight in thinking about tomorrow's.

As ever, the world economy is the key driver of energy consumption. It is easy to forget that until the middle of 2008, the economy continued to grow. In retrospect, last year represented the end of one of the strongest periods of economic growth ever recorded. However, the economy had already started to slow, most likely not unrelated to the high price of energy, and the financial crisis in September then triggered a sharp recession – with critical implications for global energy consumption.

Energy prices followed these economic headlines, making for a year of very different parts. Oil prices increased steadily early in the year, exceeding \$140 per barrel in early July – a record even on an inflation-adjusted basis. But then prices collapsed, falling by more than 70% by the end of the year. Market prices for natural gas and coal followed similar trajectories. Over the whole of 2008, average prices for all forms of primary energy increased significantly, with annual oil prices rising for a seventh consecutive year, a first in the nearly 150-year history of the oil industry.

Primary energy consumption growth slowed in 2008, as did growth for each of the fossil fuels. All the net growth in energy consumption came from the rapidly industrializing non-OECD economies, with China alone accounting for nearly three-quarters of global growth. For the first time, non-OECD energy consumption surpassed OECD consumption. For a sixth consecutive year, coal was the fastest-growing fuel – with obvious implications for global CO₂ emissions.

The use of renewable fuels again rose rapidly, often benefitting from government support. Although renewable energy continues to play only a small role in the world's energy mix, the share is rising rapidly in some countries and there are the beginnings of a material impact. Data on renewable energy – ethanol production as well as wind, solar and geothermal power generation capacity – may be found at www.bp.com/statisticalreview.

In 2008 the world was no longer supply-constrained, as production growth exceeded that of consumption for all fossil fuels, particularly later in the year. Expanded OPEC production drove increases in world oil supply, even as consumption declined. The cost-effective development of unconventional gas, enabled by technological innovation, drove the largest-ever increase in US natural gas supply, and for coal, strong growth in China was once again a key driver. Seen in this context, fundamental market forces help to explain the downward pressure seen on energy prices later in the year.

Our data confirms that the world has enough proved reserves of oil, natural gas and coal to meet the world's needs for decades to come. The challenges the world faces in growing supplies to meet future demand are not below ground, they are above ground. They are human, not geological.

I would like to thank all those around the world who have been involved in preparing this Review – in particular our government contacts in many countries who helped to compile the data.

2008 in review

Global energy consumption growth slowed in 2008, with slower economic growth and higher average prices breaking a string of five consecutive years of above-average growth. Production growth exceeded that of consumption for all fossil fuels.

For the year as a whole, prices for all forms of traded energy rose substantially despite sharp declines late in the year. Oil prices reached inflation-adjusted record highs, rising for a seventh consecutive year. Internationally traded coal prices rose more steeply than other fuels. Natural gas prices in Europe and for Asia-Pacific liquefied natural gas (LNG) rose in line with – or more rapidly than – oil prices, while North American price increases were more moderate.

Non-OECD primary energy consumption exceeded OECD consumption for the first time.

Primary energy consumption

Shanghai, China

China accounted for three-quarters of global energy consumption growth.

Energy developments

World primary energy consumption – including oil, natural gas, coal, nuclear and hydro power – grew by 1.4% in 2008, the slowest growth since 2001. Non-OECD primary energy consumption exceeded OECD consumption for the first time. The Asia-Pacific region accounted for 87% of the world's energy consumption growth. For the third consecutive year, coal accounted for the majority of primary energy consumption growth. Chinese consumption growth slowed for the fifth consecutive year, yet China accounted for nearly three-quarters of global growth. Energy consumption among exporting regions remained robust, with above-average growth in the Middle East and Africa. Consumption in the US fell by 2.8%, the largest decline since 1982.

Oil

Dated Brent averaged \$97.26 per barrel in 2008, an increase of 34%. Other benchmark crudes registered similar gains. Prices began the year just below \$100 and rose sharply through mid-year, peaking above \$144 in early July. But with strong OPEC production growth and the world economy – and oil consumption – weakening, inventories increased and prices declined sharply thereafter, ending the year below \$40. An easing of refinery bottlenecks led to a narrowing of crude quality differentials in the second half of the year.

Global oil consumption declined by 0.6%, or by 420,000 barrels per day (b/d), the first decline since 1993 and the largest decline since 1982. Consumption in OECD countries fell by 3.2% (1.5 million b/d), a third consecutive year of decline – led by a drop of 6.4%, or nearly 1.3 million b/d, in the US. Outside the OECD, consumption growth slowed to 1.1 million b/d, with continued strong growth among oil exporting countries partly offset by slower growth among Asia-Pacific importers.

 Oil production outside OPEC fell by 1.4% or 610,000b/d, the largest decline since 1992. 

While oil consumption declined, global oil production increased by 0.4%, or 380,000b/d. Although OPEC began cutting production late in the year, average annual production rose by 2.7%, or 990,000b/d. Middle Eastern OPEC members accounted for all of the net increase, with Saudi Arabian production rising by nearly 400,000b/d and Iraqi output rising by 280,000b/d.

Oil production outside OPEC fell by 1.4% or 610,000b/d, the largest decline since 1992. OECD production fell by 4%, or 750,000b/d, with declines in North America and Europe; Mexican production fell by 310,000b/d, the world's largest decline. Russian production fell by 90,000b/d, the first decline since 1998. These declines were partly offset by continued growth in Brazilian output of 70,000b/d.

Refining capacity additions in 2008 totalled some 830,000b/d, with most of the additions concentrated in the Asia-Pacific region, especially China where capacity grew by 2.9% (220,000b/d). However, global crude runs fell by 250,000b/d because of lower oil consumption. The biggest throughput changes were a fall of 3.4% (510,000b/d) in the US, partially offset by growth of 4.4% (290,000b/d) in China. The combination of increasing refining capacity and lower crude runs meant

Thunder Horse field,
Gulf of Mexico, US
US oil consumption
fell by 6.4% or nearly
1.3 million b/d.

that global refinery utilization in 2008 fell for the third year running to 84.8%, the lowest level since 2003.

Global oil trade fell by 1.7% or 930,000b/d, the first decline since 2002 and the largest since 1987, driven by declining consumption among importing countries (especially in the OECD) and rising domestic consumption among the world's oil exporters.

Global oil consumption

-0.6%
The first decline
since 1993

LNG plant, North West Shelf, Australia
Global natural gas trade rebounded in 2008, growing by 3.8%; LNG trade for the year fell slightly.

Natural gas share of world energy consumption

24.1%

Natural gas accounts for 24.1% of world energy use, the highest share on record.

Natural gas

Global gas consumption grew by 2.5%, below the 10-year average. In North America, spot gas prices for the year remained well below oil prices and consumption grew by an above-average 1.3%. Elsewhere only the Middle East saw above-average growth, driven by strong domestic consumption among energy-exporting nations and a rapid expansion of intra-regional trade. In OECD Europe and the Asia-Pacific region, oil-indexed gas prices rose more rapidly and consumption growth was below average. Chinese consumption grew by 15.8%, and China accounted for the largest incremental growth in world gas consumption.

 In the US output rose by 7.5%, 10 times the 10-year average and the strongest volumetric growth on record. 

Global gas production grew by 3.8%, above the 10-year average of 3%. Strong growth was driven by the US, which for the second consecutive year accounted for the largest increment to global production. In the US output rose by 7.5%, 10 times the 10-year average and the strongest volumetric growth on record. The development of unconventional resources and strong drilling activity (which began to decline later in the year as prices weakened) drove the US increase. Qatar accounted for the second-largest increment to supply as pipeline shipments to the UAE continued to ramp up. EU production rose for the first time since 2004, as increases in the Netherlands and Denmark offset UK declines.

Global natural gas trade rebounded in 2008, growing by 3.8%, driven by growth in pipeline shipments; LNG trade for the year fell slightly. Pipeline trade increased by 5.5%; the ramp-up of Qatari exports accounted for 36% of global growth, and shipments also increased from Russia and several European countries, more than offsetting declining Canadian shipments to the US. Meanwhile, breaking a recent pattern of strong growth, global LNG shipments were limited by constrained supply.

Other fuels

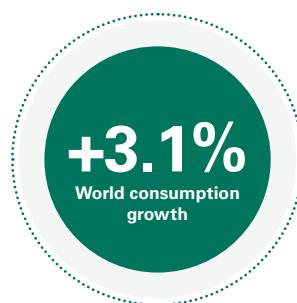

Global coal consumption slowed in 2008, rising by a below-average 3.1%, yet coal remained the fastest-growing fuel in the world for a sixth consecutive year. In China (the world's largest consumer, with a 43% share), consumption grew by 6.8%, below the 10-year average but still sufficient to account for 85% of global growth. In liberalized energy markets, coal prices in 2008 increased more rapidly than other fossil fuels; consumption growth outside China was a weak 0.6%. Growth was below the 10-year average for every region but South and Central America and Africa.

Nuclear output dropped by 0.7%, a second consecutive global decline. Japanese output fell by 10% due to the lingering impact of a 2007 earthquake. Hydroelectric generation grew by 2.8%, with global growth above the 10-year average for the fourth time in the past five years. Chinese hydroelectric output grew by 20.3%, double the 10-year average and sufficient to account for all the global increase. Elsewhere

hydroelectric output was weaker than average, falling by 0.4%.

Renewable energy continued to grow strongly. Global wind and solar generation capacity increased by 29.9% and 69%, respectively – both figures above the 10-year average. Driven by a favourable policy environment, US wind capacity rose by 49.5%, surpassing Germany as the world's capacity leader. Ethanol production rose by one-third driven by continued strong growth in the US and Brazil.

Coal was again the world's fastest growing fuel

Acknowledgements

We would like to express our gratitude to the many contacts worldwide who provide the basic publicly-available data for this publication.

Coal

In liberalized energy markets, coal prices in 2008 increased more rapidly than other fossil fuels.

•Remaining established reserves', less reserves 'under active development'.

Notes: Proved reserves of oil – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions.

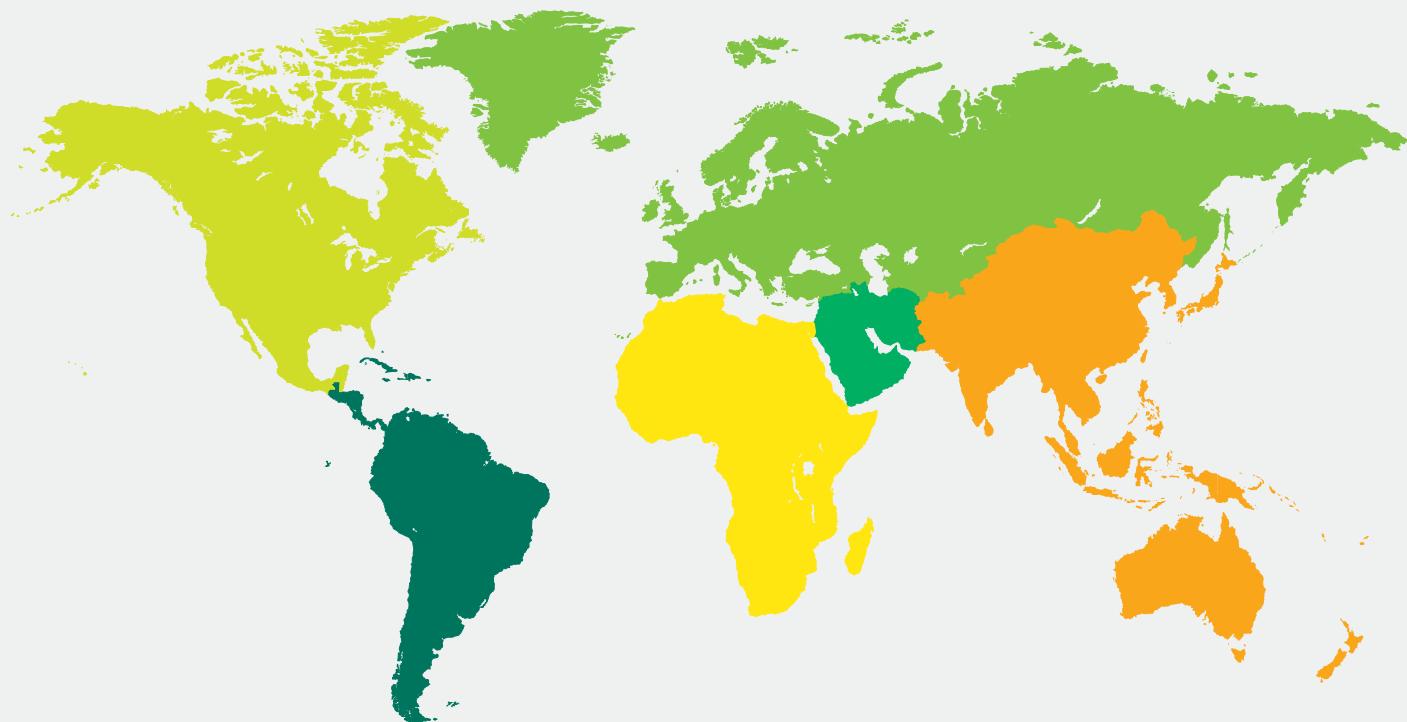

Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Source of data – The estimates in this table have been compiled using a combination of primary official sources, third-party data from the OPEC Secretariat, *World Oil, Oil & Gas Journal* and an independent estimate of Russian reserves based on information in the public domain. Canadian proved reserves include an official estimate of 22.0 billion barrels for oil sands 'under active development'. Reserves include gas condensate and natural gas liquids (NGLs) as well as crude oil.

Annual changes and shares of total are calculated using thousand million barrels figures.

*Includes crude oil, shale oil, oil sands and NGLs (the liquid content of natural gas where this is recovered separately). Excludes liquid fuels from other sources such as biomass and coal derivatives.

†Excludes Former Soviet Union.

‡Less than 0.05%.

Note: Growth rates are adjusted for leap years.

Production by region

Million barrels daily

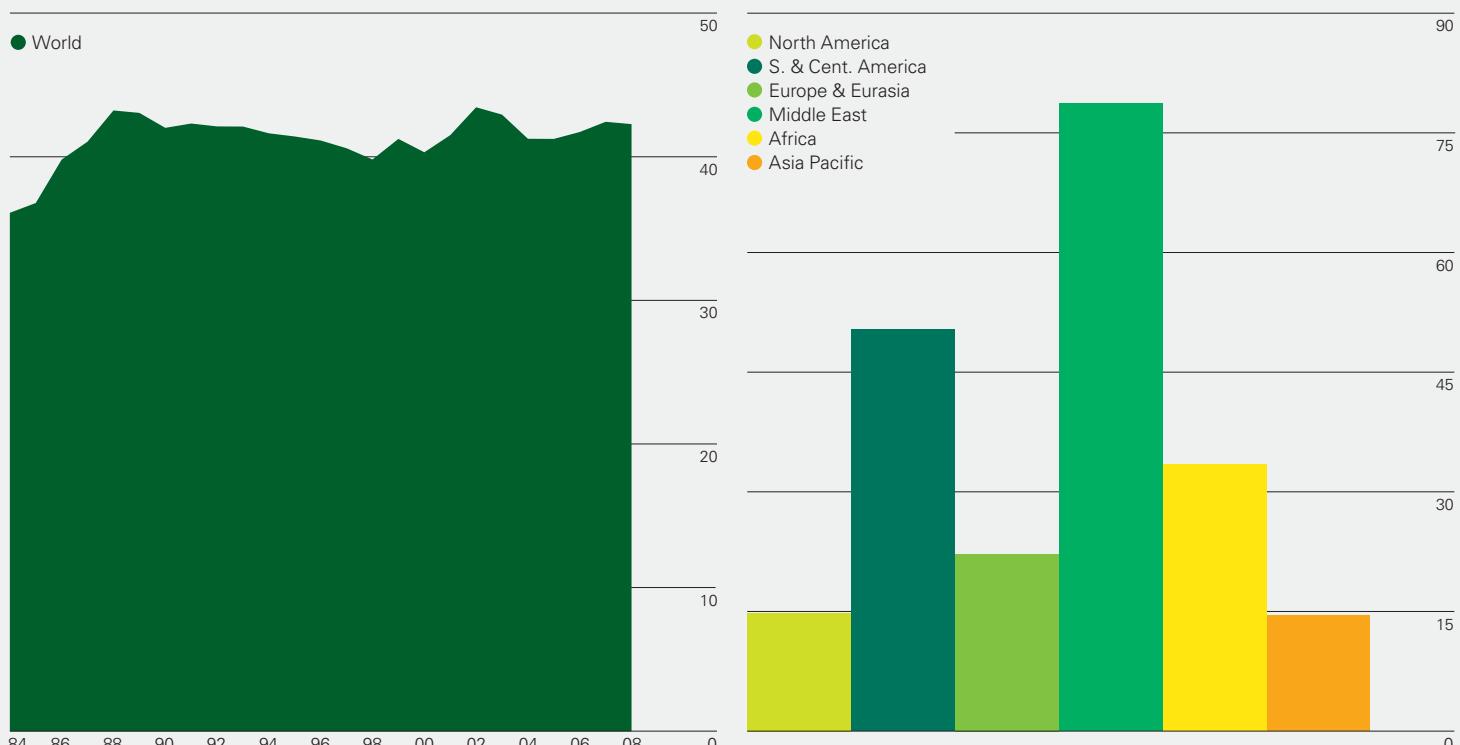

World oil production increased by 380,000b/d in 2008. OPEC production increased by 990,000b/d despite production cuts instituted late in the year. Saudi Arabia saw the largest production increase, with output rising by 400,000b/d. Russian production fell by 90,000b/d, the first decline since 1998. OECD production fell by 750,000b/d, with Mexico registering the world's largest decline (310,000b/d).

Reserves-to-production (R/P) ratios

Years

2008 by region

Global proved oil reserves in 2008 fell by 3 billion barrels to 1,258 billion barrels, with an R/P ratio of 42 years. Declines in Russia, Norway, China and other countries offset increases in Vietnam, India and Egypt. The 2007 figure has been revised higher by 23.1 billion barrels, with the largest upward revisions in Venezuela and Angola.

*Inland demand plus international aviation and marine bunkers and refinery fuel and loss. Consumption of fuel ethanol and biodiesel is also included.

†Less than 0.05%.

Notes: Annual changes and shares are calculated using million tonnes per annum figures.

Growth rates are adjusted for leap years.

Differences between these world consumption figures and world production statistics on page 8 are accounted for by stock changes, consumption of non-petroleum additives and substitute fuels, and unavoidable disparities in the definition, measurement or conversion of oil supply and demand data.

Consumption by region

Million barrels daily

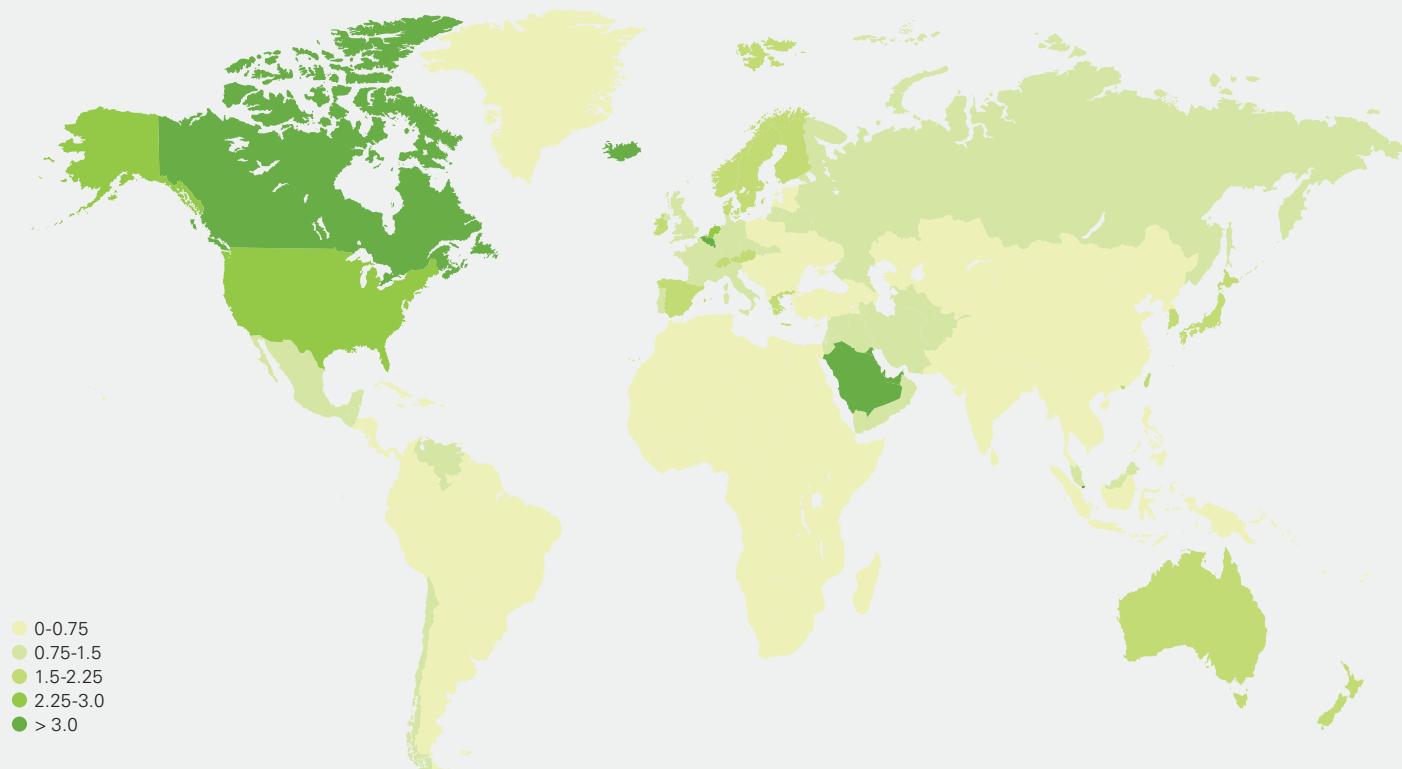

- Asia Pacific
- Africa
- Middle East
- Europe & Eurasia
- S. & Cent. America
- North America

World oil consumption fell by 420,000b/d, the largest decline since 1982. OECD consumption fell by 1.5 million b/d, driven by a decline of nearly 1.3 million b/d in the US. China again recorded the world's largest incremental growth, rising by 260,000b/d. Consumption growth was above the 10-year average in the exporting regions of the Middle East, South and Central America, Africa and the Former Soviet Union.

Consumption per capita 2008

‡Excludes Former Soviet Union.

Notes: Annual changes and shares of total are calculated using thousand barrels daily figures.

'Light distillates' consists of aviation and motor gasolines and light distillate feedstock.

'Middle distillates' consists of jet and heating kerosenes, and gas and diesel oils (including marine bunkers).

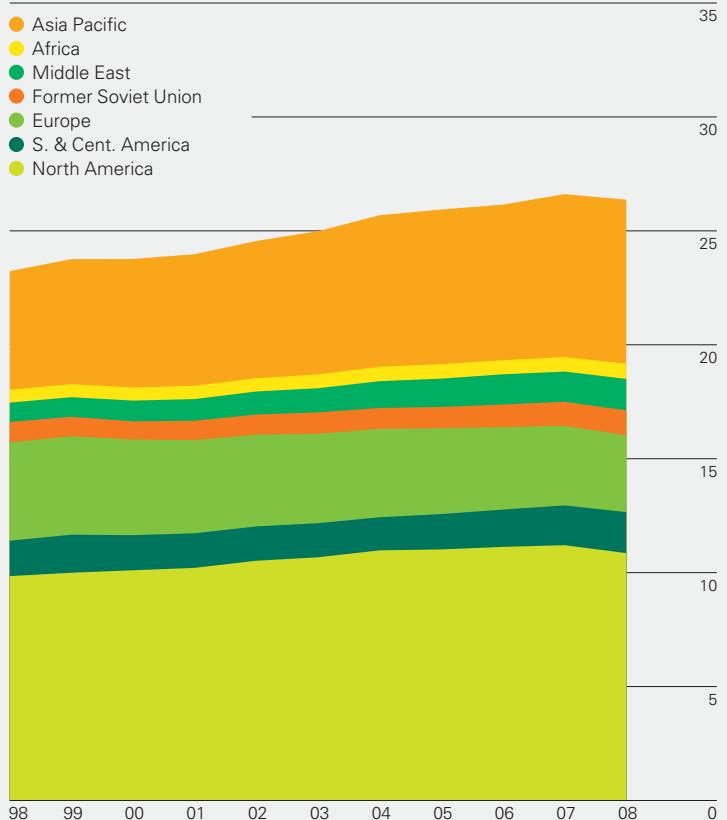

'Fuel oil' includes marine bunkers and crude oil used directly as fuel.

'Others' consists of refinery gas, LPG, solvents, petroleum coke, lubricants, bitumen, wax, other refined products and refinery fuel and loss.

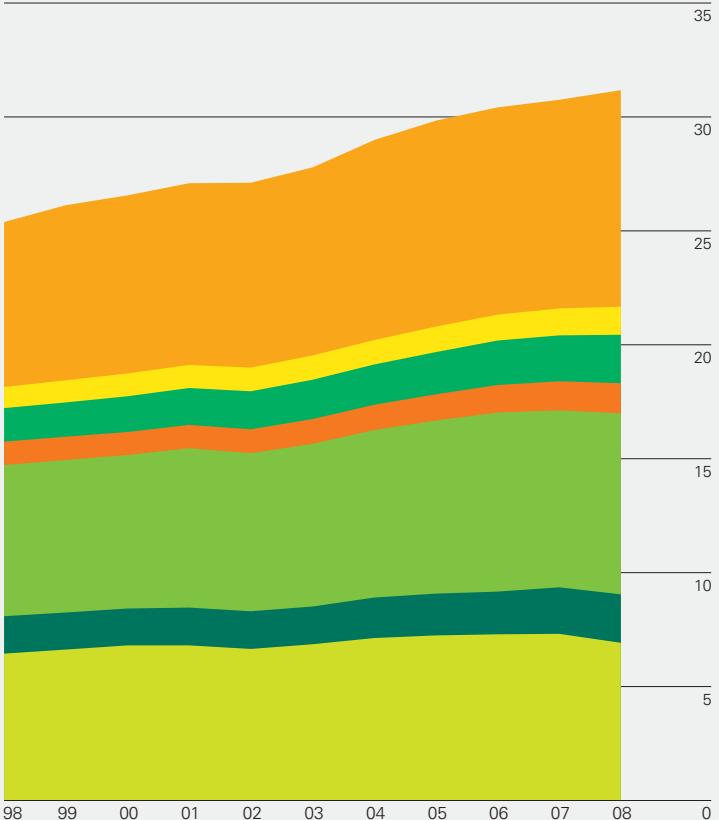

Product consumption by region

Million barrels daily

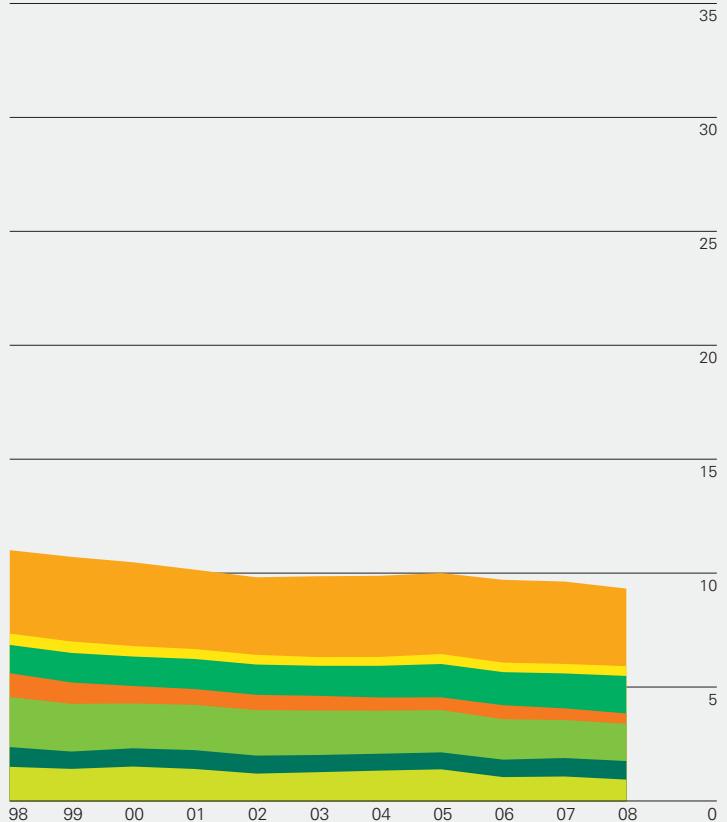

Light distillates

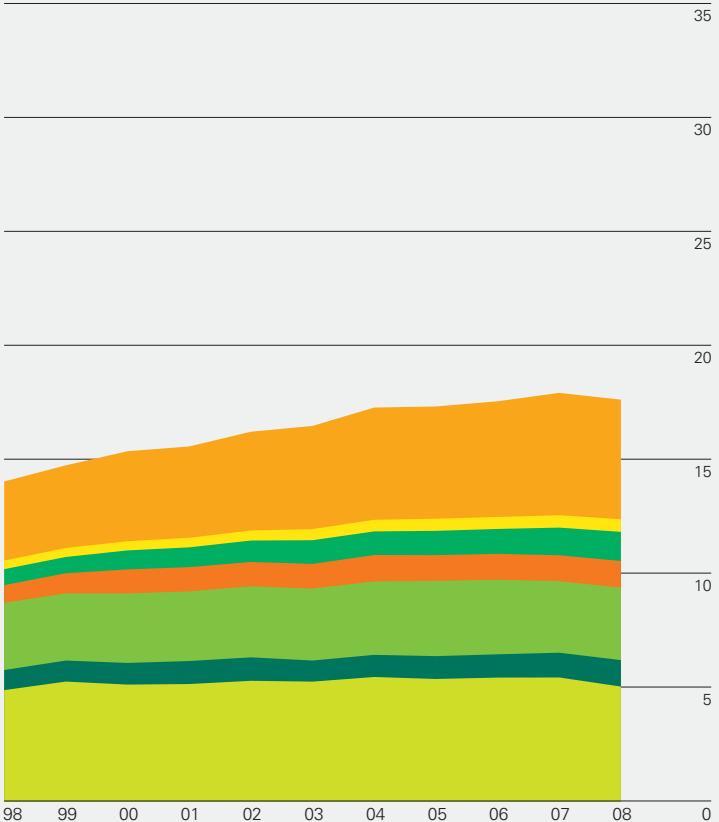

Middle distillates

Fuel oil

Others

Consumption growth was below the 10-year average for all fuel groups, with declines in three of the four reported categories. Middle distillates has been the fastest-growing fuel group in five of the past six years, and was the only fuel group to grow globally in 2008.

Refinery utilization

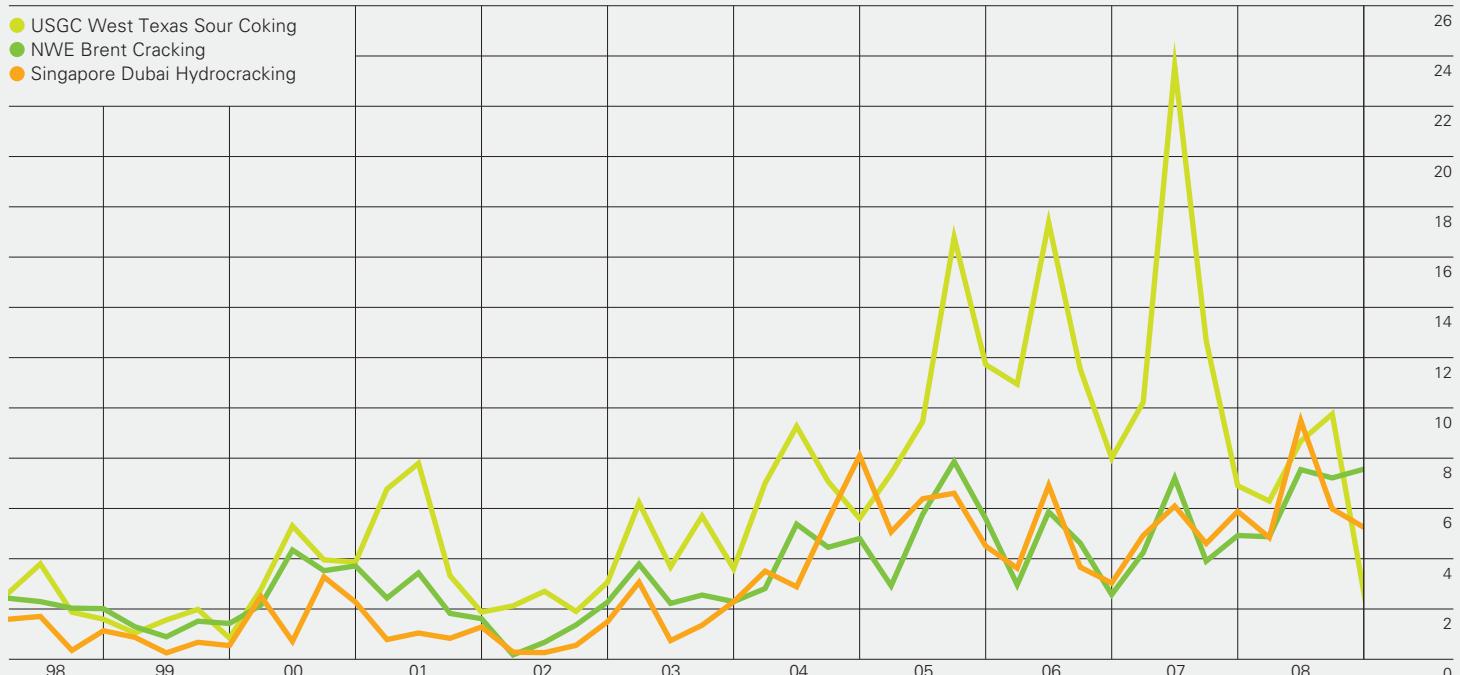

Percentage

Global oil demand fell in 2008 and so did refinery crude runs. The biggest reduction was in the US, where throughputs fell by 510,000b/d. Crude runs continued to grow in China in support of domestic demand. Meanwhile global refining capacity grew by 830,000b/d, mainly in Asia Pacific. As a result, global average refinery utilization fell to 84.8%, the lowest level since 2003.

Regional refining margins

US dollars per barrel

Note: The refining margins presented are benchmark margins for three major global refining centres: US Gulf Coast (USGC), North West Europe (NWE – Rotterdam) and Singapore. In each case, they are based on a single crude oil appropriate for that region and have optimized product yields based on a generic refinery configuration (cracking, hydrocracking or coking), again appropriate for that region. The margins are on a semi-variable basis, i.e. the margin after all variable costs and fixed energy costs.

*Includes unidentified trade.

†Excludes Japan. Excludes trade between other Asia Pacific countries and India prior to 2007.

Note: Annual changes and shares of total are calculated using thousand barrels daily figures.

Notes: Proved reserves of natural gas – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions.

Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Source of data – The estimates in this table have been compiled using a combination of primary official sources and third-party data from Ceditaz and the OPEC Secretariat.

*Excluding gas flared or recycled.

Source: Includes data from Cedigaz.

Notes: As far as possible, the data above represents standard cubic metres (measured at 15°C and 1013 millibar (mbar); because it is derived directly from tonnes of oil equivalent using an average conversion factor, it does not necessarily equate with gas volumes expressed in specific national terms.

Annual changes and shares of total are calculated using million tonnes of oil equivalent figures.

Growth rates are adjusted for leap years.

Natural gas production data expressed in billion cubic feet per day is available at www.bp.com/statisticalreview.

Source: Includes data from Cedigaz.

Note:

Growth rates are adjusted for leap years.

Production by region

Billion cubic metres

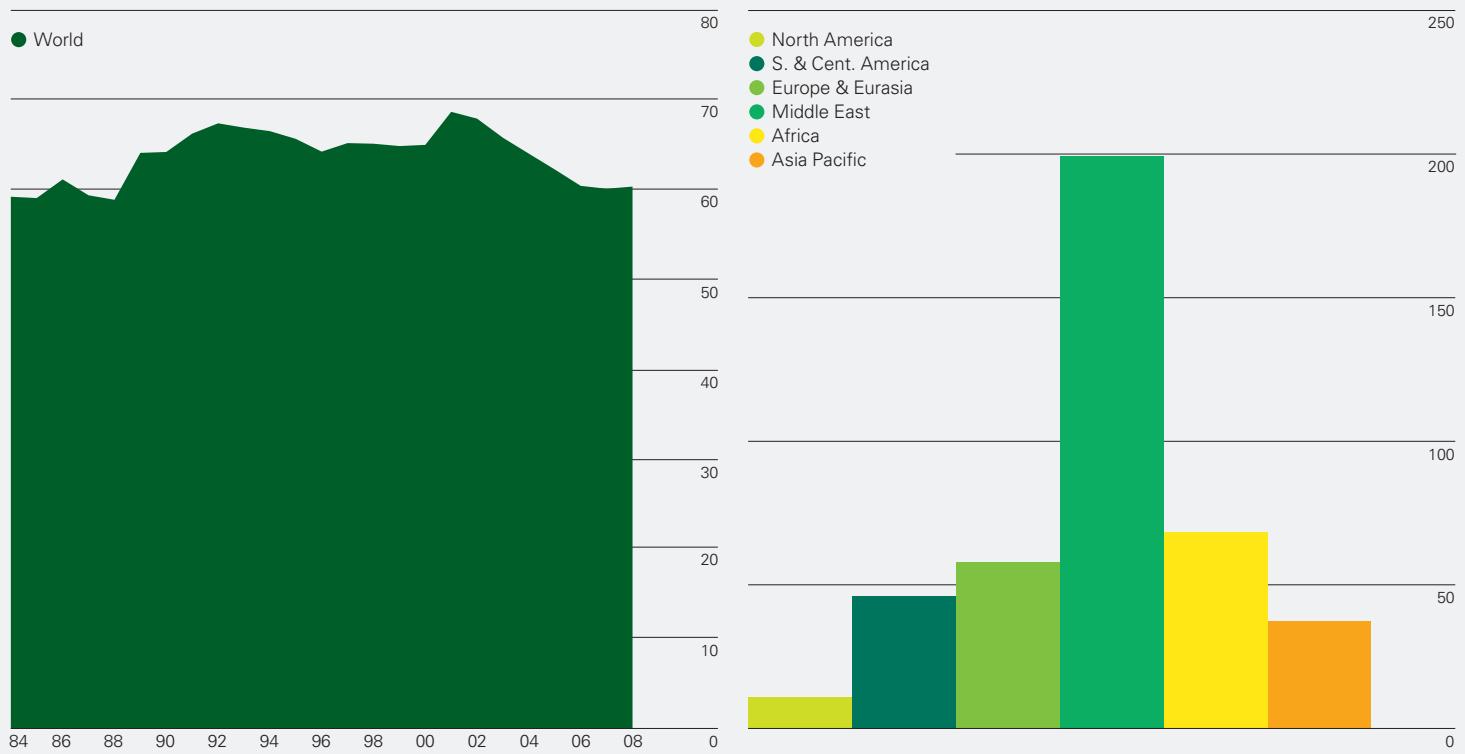

World natural gas production grew by a robust 3.8% in 2008, the strongest volumetric growth since 1984. For the second consecutive year, the US recorded the largest increase, with growth of 41.7bcm. Growth was below the 10-year average for all regions except North America and Europe and Eurasia. Canada recorded the world's largest decline.

Reserves-to-production (R/P) ratios

Years

2008 by region

Global proved reserves of natural gas increased by 7.97tcm in 2008, and the R/P ratio increased to 60.4 years. Increases in Turkmenistan and Iran accounted for most of the growth.

Consumption by region

Billion cubic metres

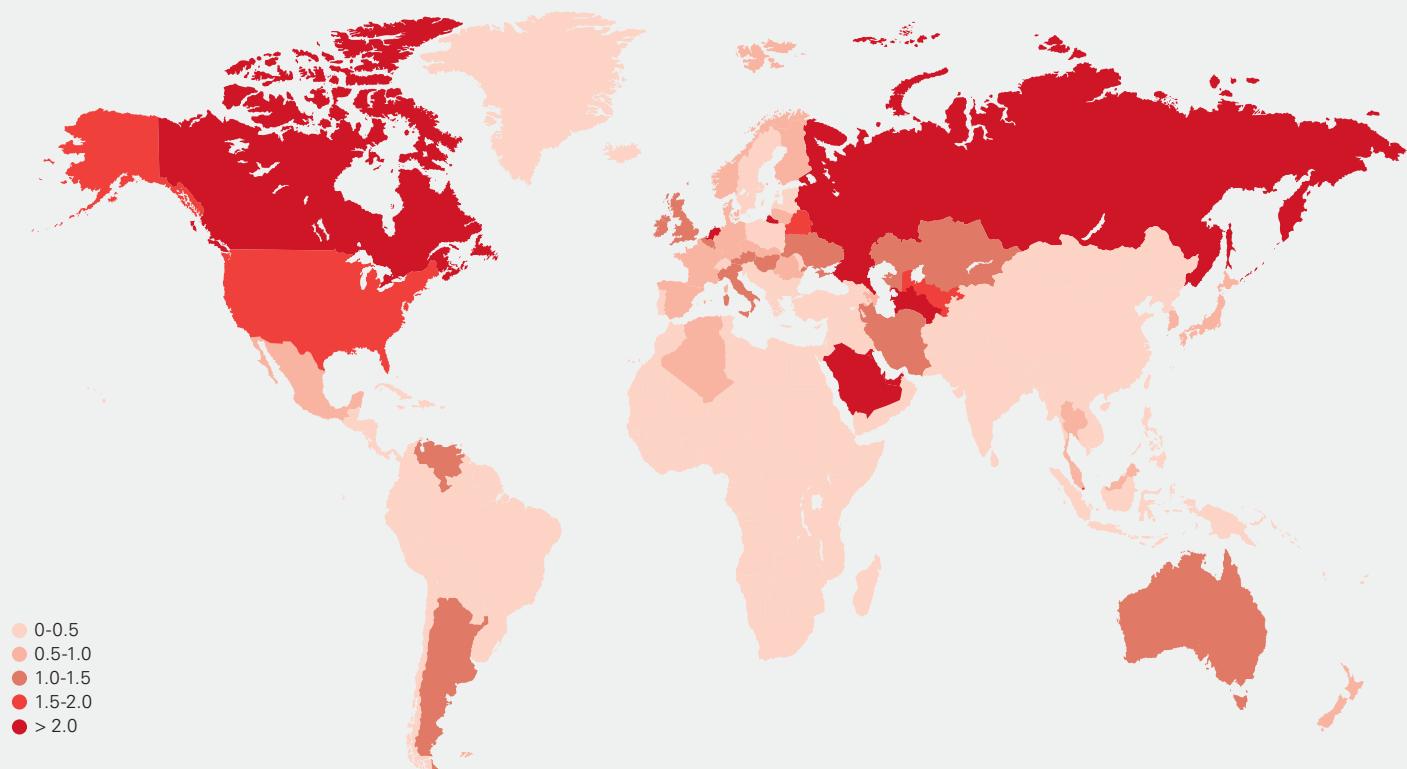

- Rest of World
- Asia Pacific
- Europe & Eurasia
- North America

World natural gas consumption grew by 2.5% in 2008, below the historical average. Growth was broadly distributed, although only North America and the Middle East saw above average growth in aggregate. China accounted for the largest increment to gas consumption, while Russia recorded the largest decline.

Consumption per capita 2008

Tonnes oil equivalent

Notes: Proved reserves of coal – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known deposits under existing economic and operating conditions.

Reserves-to-production (R/P) ratio – If the reserves remaining at the end of the year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Source of reserves data: World Energy Council, 2009.

● 2008

Consumption

Million tonnes oil equivalent

World coal consumption grew by 3.1% in 2008, the first below-average increase since 2002. Coal nonetheless remained the fastest-growing primary energy source for the sixth consecutive year. China accounted for more than 85% of global growth even though Chinese consumption growth was below average.

*Based on gross generation and not accounting for cross-border electricity supply. Converted on the basis of thermal equivalence assuming 38% conversion efficiency in a modern thermal power station.

†Less than 0.05%.

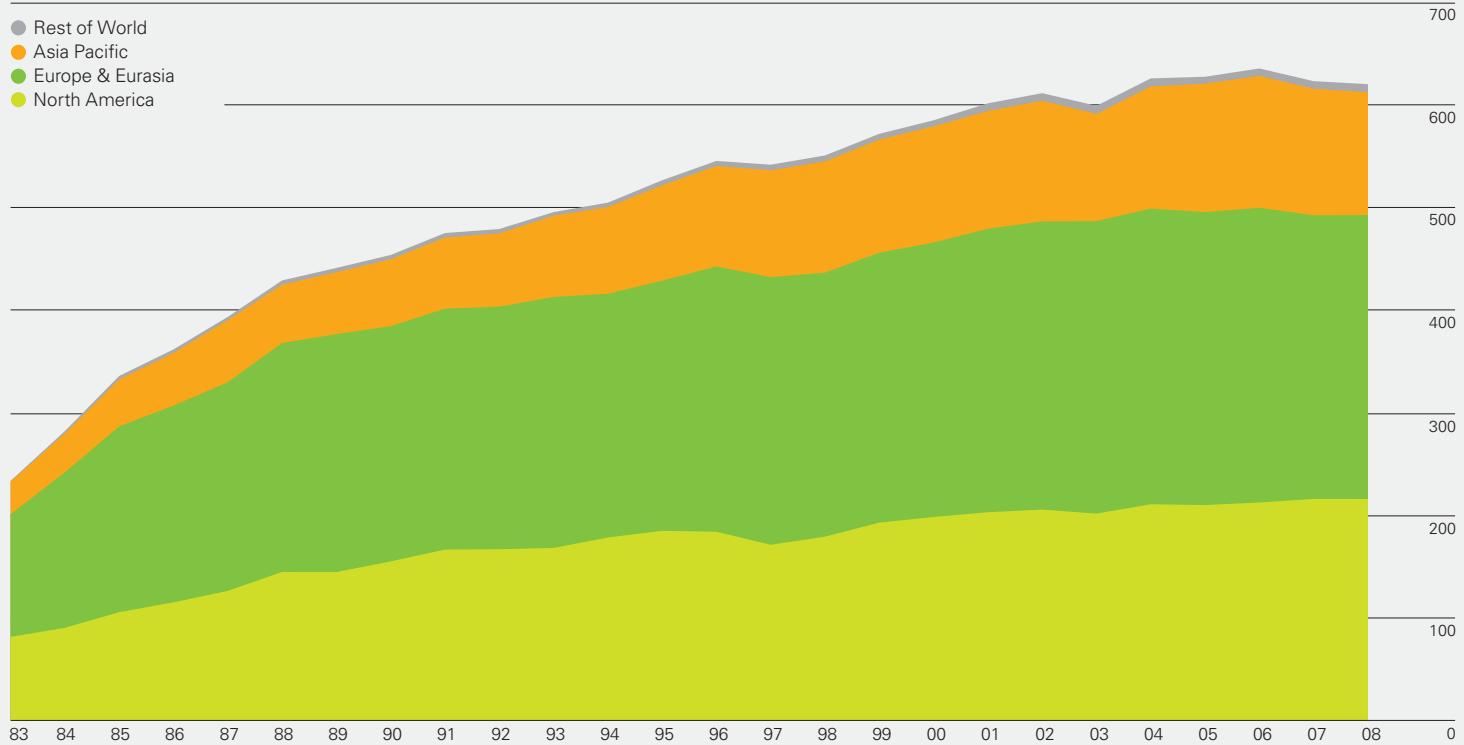

♦Less than 0.05%.

Notes: Growth rates are adjusted for leap years.

Nuclear energy data expressed in terawatt-hours is available at www.bp.com/statisticalreview.

Consumption by region

Million tonnes oil equivalent

Global nuclear power generation declined for a second consecutive year. Maintenance-related declines in Japan and the United Kingdom were only partly offset by growth in China and a recovery in utilization in Germany and South Korea.

Hydroelectricity

*Based on gross primary hydroelectric generation and not accounting for cross-border electricity supply. Converted on the basis of thermal equivalence assuming 38% conversion efficiency in a modern thermal power station.

†Less than 0.05.

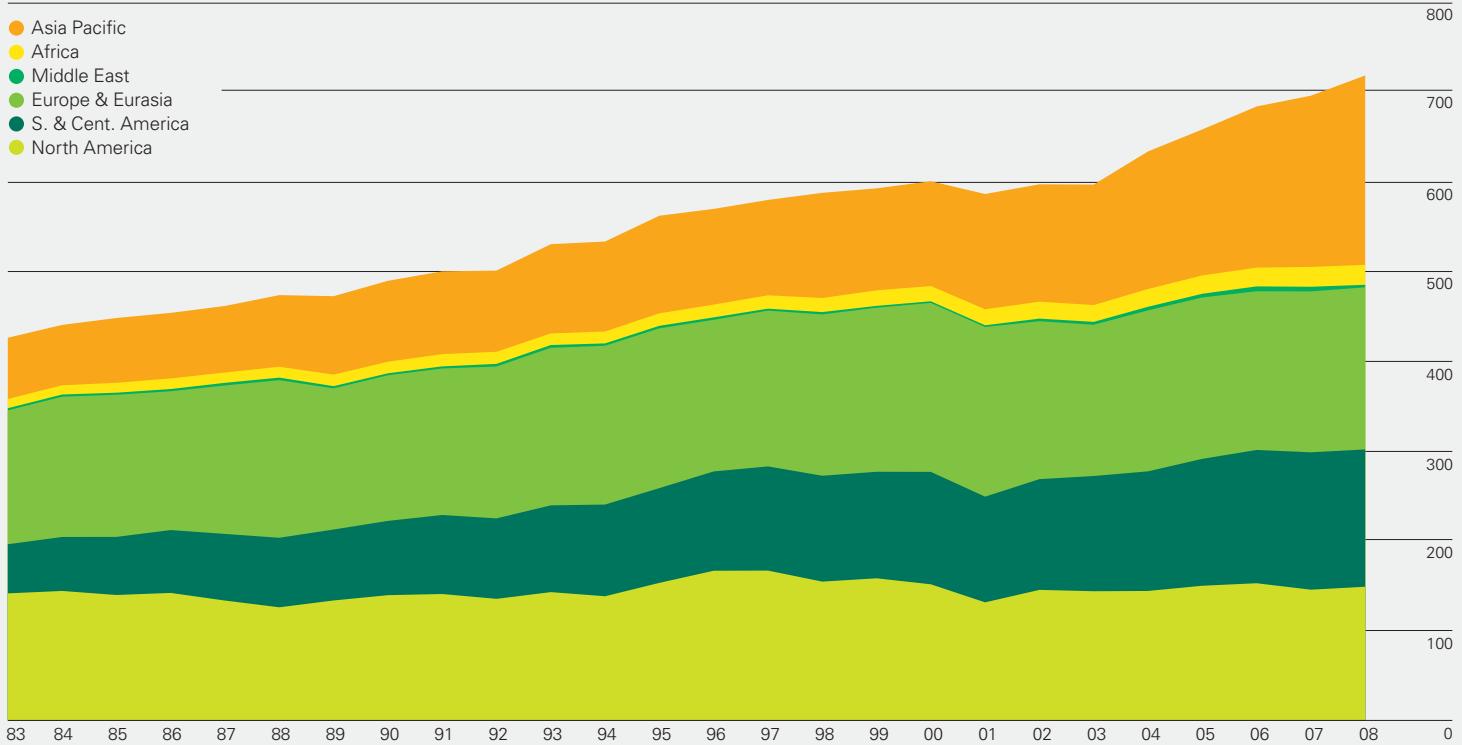

♦Less than 0.05%.

Notes: Growth rates are adjusted for leap years.

Hydroelectricity data expressed in terawatt-hours is available at www.bp.com/statisticalreview.

Consumption by region

Million tonnes oil equivalent

Global hydroelectric output increased by an above-average 2.8% in 2008. China accounted for all the world's net increase, with output rising by 20.3% on strong capacity growth and increased rainfall.

*In this Review, primary energy comprises commercially traded fuels only. Excluded, therefore, are fuels such as wood, peat and animal waste that, though important in many countries, are unreliable documented in terms of consumption statistics. Also excluded are wind, geothermal and solar power generation.

^tLess than 0.05.

Note: Oil consumption is measured in million tonnes; other fuels in million tonnes of oil equivalent.

World consumption

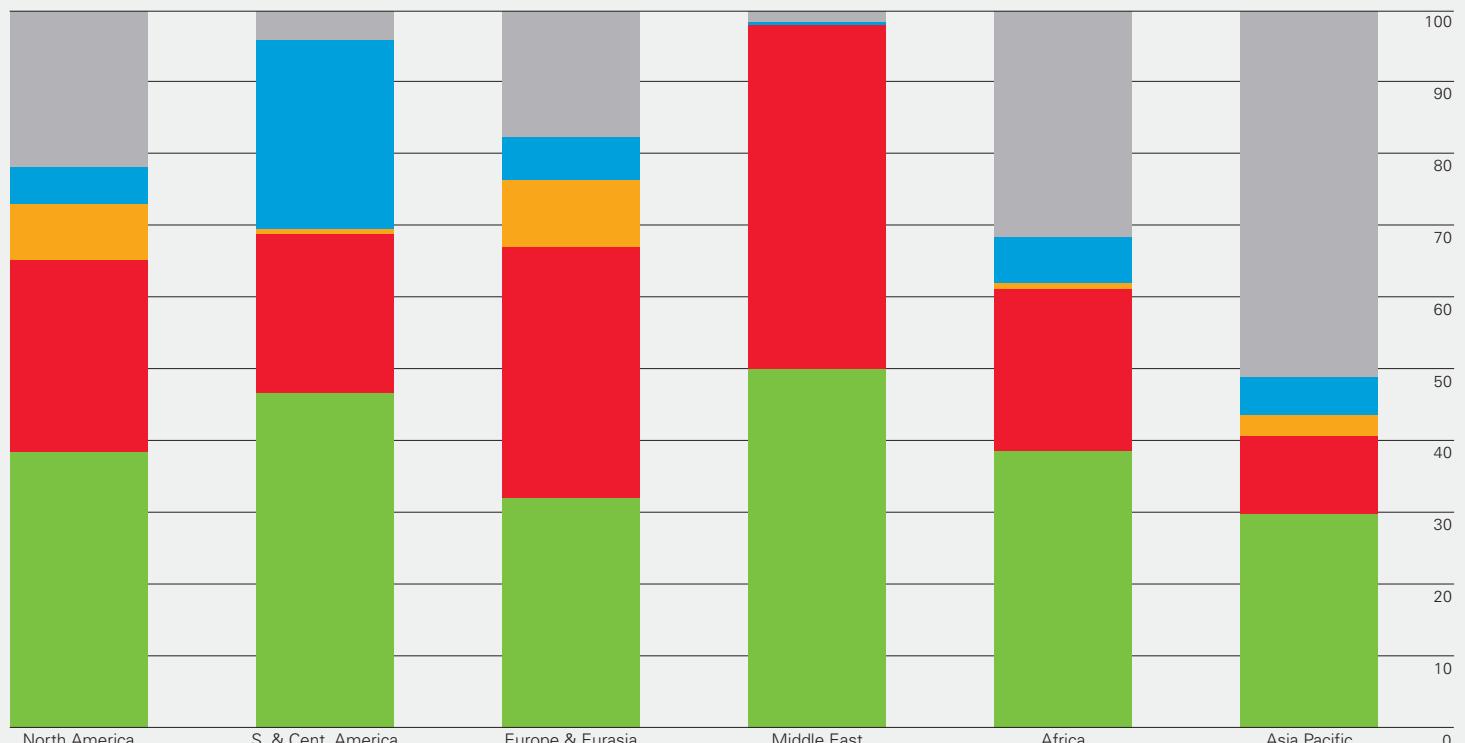

Million tonnes oil equivalent

World primary energy consumption grew by 1.4% in 2008, below the 10-year average. It was the weakest year since 2001. Oil remains the world's dominant fuel, though it has steadily lost market share to coal and natural gas in recent years. Oil's share of the world total has fallen from 38.7% to 34.8% over the past decade. Oil consumption and nuclear power generation declined last year, while natural gas and coal consumption, as well as hydroelectric generation, increased.

Regional consumption pattern 2008

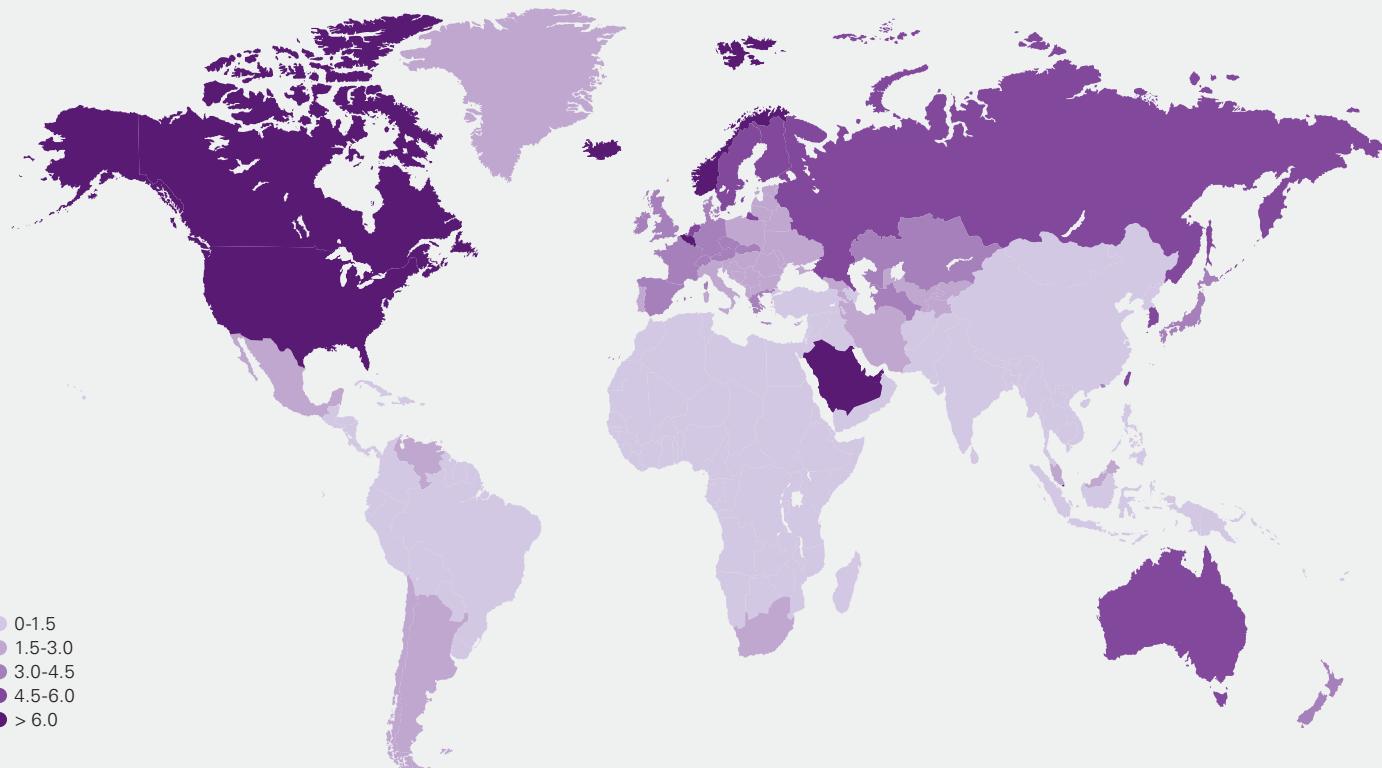

Percentage

Oil remains the world's dominant fuel, holding the leading share of consumption in all regions except Europe and Eurasia, and Asia Pacific. Coal is the dominant fuel in Asia Pacific and continues to increase its market share; the region accounts for 61.5% of global coal consumption, the largest global share for any fuel in any region. Natural gas remains the leading fuel in Europe and Eurasia.

Consumption per capita 2008

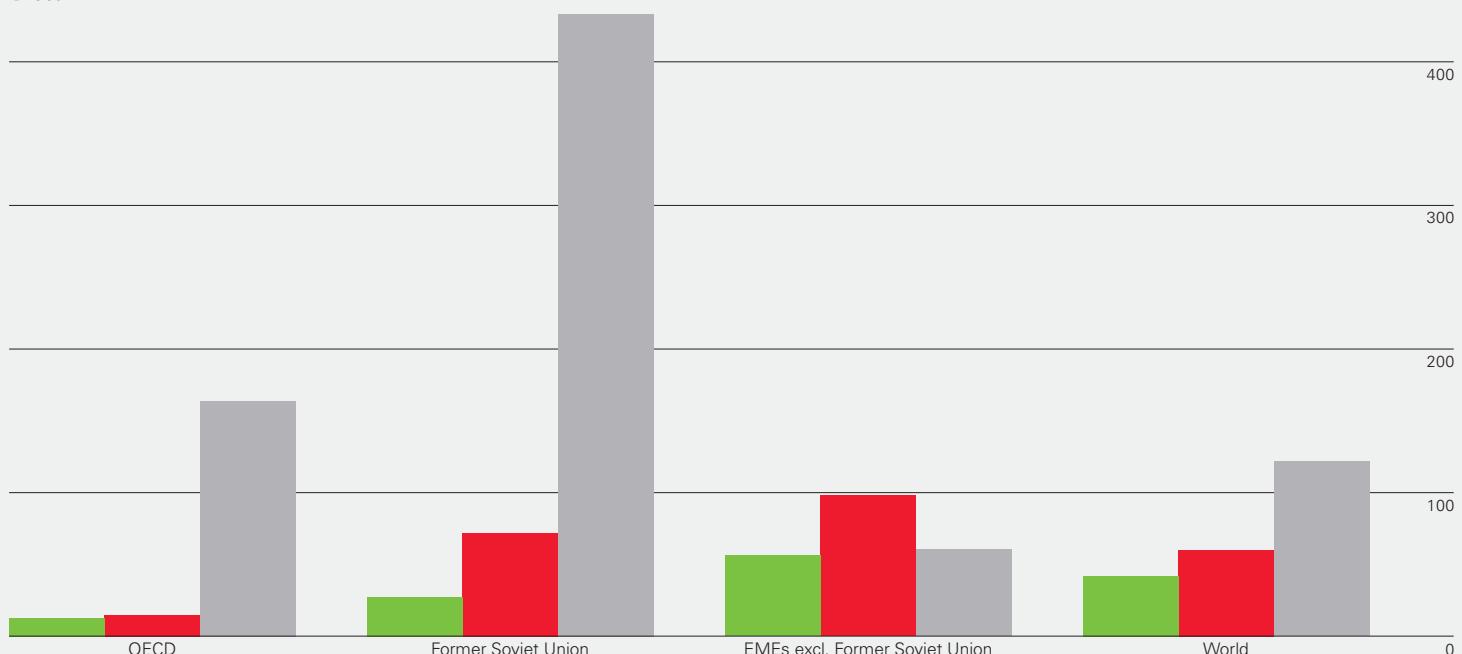

Tonnes oil equivalent

Fossil fuel reserves-to-production (R/P) ratios at end 2008

Years

- Oil
- Natural gas
- Coal

Coal remains the world's most abundant fuel, with a global R/P ratio of more than 120 years. Among fossil fuels, coal reserves remain the most closely co-located with key consuming centres in Asia Pacific and North America. Oil's global R/P ratio has tended to rise over time, and has remained above 40 years since 1998.

Definitions

Statistics published in this Review are taken from government sources and published data. No use is made of confidential information obtained by BP in the course of its business.

Country groupings are made purely for statistical purposes and are not intended to imply any judgement about political or economic standings.

North America

US (excluding Puerto Rico), Canada, Mexico.

South and Central America

Caribbean (including Puerto Rico), Central and South America.

Europe

European members of the OECD plus Albania, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, Former Yugoslav Republic of Macedonia, Gibraltar, Malta, Romania, Serbia and Montenegro, Slovenia.

Former Soviet Union

Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, Uzbekistan.

Europe and Eurasia

All countries listed above under the headings Europe and Former Soviet Union.

Middle East

Arabian Peninsula, Iran, Iraq, Israel, Jordan, Lebanon, Syria.

North Africa

Territories on the north coast of Africa from Egypt to western Sahara.

West Africa

Territories on the west coast of Africa from Mauritania to Angola, including Cape Verde, Chad.

East and Southern Africa

Territories on the east coast of Africa from Sudan to Republic of South Africa. Also Botswana, Madagascar, Malawi, Namibia, Uganda, Zambia, Zimbabwe.

Asia Pacific

Brunei, Cambodia, China, China Hong Kong SAR*, Indonesia, Japan, Laos, Malaysia, Mongolia, North Korea, Philippines, Singapore, South Asia (Afghanistan, Bangladesh, India, Myanmar, Nepal, Pakistan, Sri Lanka), South Korea, Taiwan, Thailand, Vietnam, Australia, New Zealand, Papua New Guinea, Oceania.

*Special Administrative Region.

Australasia

Australia, New Zealand.

OECD members

Europe: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Republic of Ireland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Slovakia, Spain, Sweden, Switzerland, Turkey, UK.

Other member countries: Australia, Canada, Japan, Mexico, New Zealand, South Korea, US.

OPEC members

Middle East: Iran, Iraq, Kuwait, Qatar, Saudi Arabia, United Arab Emirates.

Units

1 metric tonne = 2204.62lb

= 1.1023 short tons

1 kilolitre = 6.2898 barrels = 1 cubic metre

1 kilocalorie (kcal) = 4.187kJ = 3.968Btu

1 kilojoule (kJ) = 0.239kcal = 0.948Btu

1 British thermal unit (Btu) = 0.252kcal

= 1.055kJ

1 kilowatt-hour (kWh) = 860kcal

= 3600kJ = 3412Btu

Calorific equivalents

One tonne of oil equivalent equals approximately:

Heat units 10 million kilocalories
42 gigajoules
40 million British thermal units

Solid fuels 1.5 tonnes of hard coal
3 tonnes of lignite

Gaseous fuels See Natural gas and liquefied natural gas table

Electricity 12 megawatt-hours

One million tonnes of oil or oil equivalent produces about 4400 gigawatt-hours (= 4.4 terawatt-hours) of electricity in a modern power station.

North Africa

Algeria, Libya.

West Africa

Angola, Nigeria.

Asia Pacific

Indonesia.

South America

Ecuador, Venezuela.

European Union members

Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Republic of Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, UK.

Other EMEs (Emerging Market Economies)

South and Central America, Africa, Middle East, non-OECD Asia, non-OECD Europe.

Methodology

The primary energy values of both nuclear and hydroelectric power generation have been derived by calculating the equivalent amount of fossil fuel required to generate the same volume of electricity in a thermal power station, assuming a conversion efficiency of 38% (the average for OECD thermal power generation).

Percentages

Calculated before rounding of actuals. All annual changes and shares of totals are on a weight basis except on pages 6, 14, 18, 20 and 22.

Rounding differences

Because of rounding, some totals may not agree exactly with the sum of their component parts.

Tonnes

Metric equivalent of tons.
